# Introduction

## Thin Film Composite (TFC) Membranes

- TFC polyamide (PA) membranes first synthesized in late 70s by Cadotte et al.
- State-of-the-art desalination by reverse osmosis (RO) **>99% rejection**
- A thin (<250nm) PA selective layer on top of a porous support
- Fabricated via a rapid, exothermic, polycondensation reaction:

**interfacial polymerization**

# Interfacial Polymerization

(Tri-mesoyl-chloride)

Unstable

# A 'phase diagram' of synthesis-morphology relations in IP

Susceptibility to instability

# A 'phase diagram' of synthesis-morphology relations in IP

# A 'phase diagram' of synthesis-morphology relations in IP

# Polymer formation rate

A proxy for the formation rate:

Initial MPD flux:

$$J_0 \sim K[MPD]_0 \sqrt{6k[TMC]_0 D_0}$$

Freger V., *Langmuir* (2005)

Nowbahar et al., *J. Am. Chem. Soc.* (2018)

# A 'phase diagram' of synthesis-morphology relations in IP

# Susceptibility to instability

The support is a geometrical disturbance:

regions of faster/slower polymerization ➡ increased interfacial heterogeneity

⇒ **increased tendency to become unstable!**

(much like a rough pipe vs. smooth pipe...)

# A 'phase diagram' of synthesis-morphology relations in IP

# The Concept

Smooth

Instability  
mechanisms

Crumpled

## Results:

Supported vs.  
unsupported:

Physical  
attributes

MPD diffusion

MPD partitioning

Interfacial tension

Polymer formation  
rate

Water solubility

- As the water solubility increases the morphology is more 'intense'
- Adding a solvent increases both axis of the 'phase diagram'

# Conclusions

- Concept of linking **stability** to **morphology** via a '**phase diagram**' was demonstrated.
- Transition from **smooth** to **crumpled** film outcome of '**stable**' to '**unstable**' state.
- **Increasing** 'polymer formation rate' and/or 'susceptibility to instability' results **in more crumpled PA film morphology**.
- Recast data from literature corresponds well with our framework.

## Future work:

- **Experimental Design:** varying specific **physical attributes** to study effect on **morphology**.
- **Theoretical quantification:** to provide insight on **instability sensitivity** to various **physical attributes**.
- **Performance?**
